

**UNITED STATES DISTRICT COURT
FOR THE NORTHERN DISTRICT OF TEXAS
DALLAS DIVISION**

PERFORMANCEPARTNERS LLC,

Plaintiff

v.

NEXTGEN PARKING, LLC,

Defendant

Case No. 3:23-cv- 564

JURY TRIAL DEMANDED

ORIGINAL COMPLAINT FOR PATENT INFRINGEMENT

PerformancePartners LLC (“Plaintiff”) hereby files this Original Complaint for Patent Infringement against Defendant NestGen Parking LLC (“NextGen” or “Defendant”), and alleges, upon information and belief, as follows:

THE PARTIES

1. PerformancePartners LLC is a limited liability company organized and existing under the laws of the State of Texas with its principal place of business at 119 West Ferguson, Tyler, Texas 75702.
2. Upon information and belief, Defendant is a domestic limited liability company organized and existing under the laws of the State of Texas, with a principal place of business located at 4401 South Pinemont Drive, Suite 200, Houston, Texas 77041. Defendant may be served through its registered agent in the State of Texas at Corporation Service Company d/b/a CSC-Lawyers Incorporating Service Company, 211 East 7th Street, Suite 620, Austin, Texas 78701. On information and belief, NextGen owns, operates, or otherwise controls the certain parking facilities and/or toll facilities (individually and collectively herein as the “Facility”), including but not

limited to the means and methods of ingress and egress thereto. On information and belief, such means and methods are offered and provided to consumers throughout the State of Texas, including in this judicial District. In the alternative, NextGen maintains a business location within this judicial District. On information and belief, NextGen specifically targets customers in the State of Texas and in this judicial District, including because the Facility and/or the business location of NextGen is physically located in the State of Texas and in this judicial District.

JURISDICTION AND VENUE

3. This Court has subject matter jurisdiction over this case under 28 U.S.C. §§ 1331 and 1338.
4. This Court has personal jurisdiction over Defendant. Defendant has continuous and systematic business contacts with the State of Texas. Defendant directly conducts business extensively throughout the State of Texas by owning, operating, or otherwise controlling the Facility and the means and methods of ingress and egress thereto. Defendant has purposefully and voluntarily made its services, including the infringing systems and methods, available to residents of this District and into the stream of commerce with the intention and expectation that they will be used by consumers in this District.
5. On information and belief, Defendant maintains physical brick-and-mortar business locations in the State of Texas and within this District, retains employees specifically in this District for the purpose of servicing customers in this District (including at the Facility), and generates substantial revenues from its business activities in this District.

See <http://nextgenparking.net/solutions/>.

6. On information and belief, NextGen maintains ownership, management, and/or control over the Facility, including but not limited to the means of ingress and egress thereto. In addition and/or in the alternative, NextGen manages the performance of the infringing functionalities directly or otherwise through agents specifically authorized to manage such infringing functionalities on behalf of NextGen. In addition and/or in the alternative, NextGen provides the hardware and software which collectively directly perform the infringing functionalities.
7. Venue is proper in the Northern District of Texas as to Defendant pursuant to at least 28 U.S.C. §§ 1391(c)(2) and 1400(b). As noted above, Defendant maintains a regular and established business presence in this District.

PATENTS-IN-SUIT

8. Plaintiff is the sole and exclusive owner, by assignment, of U.S. Patent No. 7,525,435 (hereinafter “the Performance Partners Patent” or “the ’435 Patent”).
9. By operation of law, the Performance Partners Patent was originally issued and exclusively vested to the sole named inventor, C. Joseph Rickrode, as of the date of issuance on April 28, 2009. *See*

35 U.S.C. § 261; *Schwendimann v. Arkwright Advanced Coating, Inc.*, 959 F.3d 1065, 1072 (Fed. Cir. 2020); *Suppes v. Katti*, 710 Fed. Appx. 883, 887 (Fed. Cir. 2017); *Taylor v. Taylor Made Plastics, Inc.*, 565 Fed. Appx. 888, 889 (Fed. Cir. 2014). Mr. Rickrode, in a written instrument dated February 2, 2009, and filed with the United States Patent and Trademark Office on February 3, 2009 at Reel 022193 and Frames 0548-0550, assigned all rights, title, and interest in the Performance Partners Patent to Performance Partners LLC (of New Hampshire). Thereafter, in a written instrument dated February 11, 2023, Performance Partners LLC (of New Hampshire) assigned all rights, title, and interest in the Performance Partners Patent to the Plaintiff, PerformancePartners LLC (of Texas). The aforementioned assignment was filed with the United States Patent and Trademark Office on February 12, 2023 at Reel 062667 and Frames 0221-0224. As such, Plaintiff PerformancePartners LLC has sole and exclusive standing to assert the Performance Partners Patent and to bring these causes of action.

10. The Performance Partners Patent is valid, enforceable, and was duly issued in full compliance with Title 35 of the United States Code.
11. The inventions described and claimed in the Performance Partners Patent were invented individually and independently by C. Joseph Rickrode.
12. The Performance Partners Patent includes numerous claims defining distinct inventions.
13. The priority date of the Performance Partners Patent is at least as early as August 2, 2005. As of the priority date, the inventions as claimed were novel, non-obvious, unconventional, and non-routine.
14. The '435 Patent relates generally to methods and systems for securing, protecting, and controlling defined areas by managing access points for entering and exiting vehicles or mobile entities, and

matching entering vehicle or mobile entity identification information with exiting identification information. *See* Abstract, '435 Patent.

15. As noted, the claims of the Performance Partners Patent have priority to at least August 2, 2005 (the “Date of Invention”). At that time, the practice of cashless tolling or parking using Automatic Number Plate Recognition (“ANPR”) to achieve the advantages of the inventions claimed in the '435 Patent was still many years away. For example, as of the Date of Invention, the conventional technology for managing access points for entering and exiting vehicles was embodied in physical cards carried by the driver or passenger, as cited and argued by the Patent Examiner during prosecution of the '435 Patent. Otherwise, and further as of the Date of Invention, the alternative conventional technology for managing access points for entering and exiting vehicles was limited to Radio Frequency Identification (“RFID”) tags located in such vehicles. Of course, such RFID technologies were dependent upon a physical transponder and were incapable of obtaining electronically readable unique repeatable distinguishing characteristics of entering/exiting vehicles (such as reading the license plate) in accordance with the inventions as claimed in the '435 Patent. Only many years later, in or around 2012, did the use of ANPR to obtain distinguishing vehicle characteristics become available and begin to approach conventionality in the field. As such, the technological solutions of the Performance Partners Patent were not well-understood, routine, or conventional as of August 2005.
16. As noted, the claims of the Performance Partners Patent have priority to at least August 2, 2005. The deficiencies in the state of the art as of the Date of Invention were highly problematic, inasmuch as facility operators routinely lost millions of dollars to drivers who would readily avoid payment by simply removing the physical transponder from the vehicle or by driving without one altogether. The inventions as claimed in the '435 Patent overcame the deficiencies in the art by

offering the unconventional approach of incorporating technology for obtaining vehicle characteristics upon entry and exit, thus allowing substantial economic benefits to facility operators. As such, the technological solutions of the Performance Partners Patent were not well-understood, routine, or conventional as of August 2005, and provided greatly improved system performance over the state of the art.

17. The claims of the Performance Partners Patent are not drawn to laws of nature, natural phenomena, or abstract ideas. Although the systems and methods claimed in the Performance Partners Patent are ubiquitous now (and, as a result, are widely infringed), the specific combinations of elements and steps, as recited in the claims, were not conventional or routine as of the Date of Invention.
18. Further, the claims of the Performance Partners Patent contain inventive concepts which transform the underlying non-abstract aspects of the claims into patent-eligible subject matter.
19. Consequently, the claims of the Performance Partners Patent recite methods resulting in improved functionality of the systems on which they are performed and represent technological improvements to the operation of computers as tools of trade. The claims of the '435 Patent provide for, *inter alia*, at least the following benefits over the conventional art: (i) protecting, controlling and securing a region entered and exited by vehicles; (ii) identifying, relating, rejecting or accepting an entering vehicle as a vehicle with no potential problem as the vehicle enters into a protected or protectable area or region; (iii) providing means and method for obtaining vehicle identification information for an exiting vehicle and comparing such exiting vehicle identification with the vehicle identification of entering vehicles for a matching review of stored data thereby allowing exit of the vehicle based upon the finding of a matching identification, or not allowing the exit of the vehicle if no matching is found in the stored data base; (iv) providing means and methods for comparison and review of the obtained identification information of the entering

vehicle with stored information; and (v) creating a suitable “characteristics identity” for a given vehicle by detection of select characteristics of the vehicle such as, for example, the license plate characters. *See, e.g.*, ’435 Patent at 2:25-3:43.

20. The claims of the Asserted Patent overcome deficiencies existing in the art as of the date of invention, and comprise non-conventional approaches that transform the inventions as claimed into substantially more than mere abstract ideas. For example, as of the Date of Invention, there were no “presently operating systems which carry out the functions and provide for the many features and advantages of the present invention [as claimed in the ’435 Patent].” *See* ’435 Patent at 2:3-7. Likewise, as of the Date of Invention, there was “substantial and significant value in being able to effectively identify, monitor and in some circumstance even control vehicle access to and exit from a secured area” in the manner as described and claimed in the ’435 Patent. *See id.* at 2:8-11. The deficient state of the art and the non-conventionality of the claimed solution is illustrated by the express intrinsic statement of the inventor as follows: “There is nothing currently available which satisfies these needs and objectives.” *See id.* at 2: 19-20. The inventions as claimed overcome these deficiencies in the state of the art, and provide substantial cost savings and protections to all parties.
21. The inventions as claimed further overcome the deficiencies existing in the art as of the Date of Invention and provide substantial benefit. The benefits of the claimed inventions are derived from the improved functionalities and usefulness of the then-existing systems and methods as provided by the claimed inventions. By way of example, the inventions as claimed improved the functionality of then-existing systems and allowed for greater revenues and decreased overhead expenditures by facility owners. The inventions further improved public safety by allowing for greater access control and personnel safety. Still further, the inventions provided for more efficient

roadway and parking facility entrance and exit conditions, thereby saving substantial public time, as well as reductions in traffic congestion. Still further, the inventions as claimed allowed for greater public trust in the entities controlling toll roadways and parking areas. Yet still further, the inventions as claimed improved functionality and reliability by reducing instances of human error in data reading and/or data entry activities. Further, the inventions as claimed allowed for the reduction or elimination in the use of electronic transponders as a means of access control, thereby reducing reliance on system compatibility and individual elective participation. Yet further, the inventions as claimed provided for the reduction of electronic waste from the elimination of vehicle transponders. Yet still further, the inventions as claimed allowed for greater certainty and efficiency by issuing or offering individual tickets/tags per event. As such, the inventions as claimed provide non-conventional solutions to the conventional problems existing as of the Date of Invention. Further, each of the foregoing represent non-routine and unconventional technological solutions to the deficiencies in the art as of the Date of Invention; thus, the inventions as claimed capture inventive concepts that transform the inventions into substantially more than the mere practice of monitoring access to a location.

22. As discussing during prosecution, the inventions as claimed are directed to non-conventional methods, including by providing a multi-tiered security scheme for managing a flow of vehicles entering and exiting a host's zone of interest. Indeed, this multi-tiered security scheme is captured by the claims of the '435 Patent, and comprises an inventive concept and technological solution.
23. The inventions as claimed further overcome the deficiencies existing in the art as of the date of invention by providing methods for controlling access using vehicle information, rather than the conventional approach of relying upon transponder data or driver personal information.

24. The '435 Patent was examined by Primary United States Patent Examiner Benjamin C. Lee, together with Assistant Examiner Daniel Previl. During the examination of the '435 Patent, the United States Patent Examiners searched for prior art in the following US Classifications: 340/572.1-572.9; 340/568.1; 571; 573.1; 568.7; 825.31; and 825.34.
25. After conducting a search for prior art during the examination of the '435 Patent, the United States Patent Examiners identified and cited the following as the most relevant prior art references found during the search: (i) US 4,990,757; (ii) US 5,751,973; (iii) US 6,340,935; (iv) US 6,865,539; (v) US 6,945,303; and (vi) US 6,970,101.
26. After giving full proper credit to the prior art and having conducted a thorough search for all relevant art and having fully considered the most relevant art known at the time, the United States Patent Examiners allowed all of the claims of the '435 Patent to issue. In so doing, it is presumed that Examiners Lee and Previl used their knowledge of the art when examining the claims. *K/S Himpp v. Hear-Wear Techs., LLC*, 751 F.3d 1362, 1369 (Fed. Cir. 2014). It is further presumed that Examiners Lee and Previl had experience in the field of the invention, and that the Examiners properly acted in accordance with a person of ordinary skill. *In re Sang Su Lee*, 277 F.3d 1338, 1345 (Fed. Cir. 2002). In view of the foregoing, the claims of the '435 Patent are novel and non-obvious, including over all non-cited art which is merely cumulative with the referenced and cited prior art. Likewise, the claims of the '435 Patent are novel and non-obvious, including over all non-cited contemporaneous state of the art systems and methods, all of which would have been known to a person of ordinary skill in the art, and which were therefore presumptively also known and considered by Examiners Lee and Previl.

27. The '435 Patent is a pioneering patent, and has been cited as relevant prior art in numerous subsequent United States Patent Applications, including Applications assigned to such technology leaders as Siemens, Amazon, and Micron.
28. The claims of the '435 Patent were all properly issued, and are valid and enforceable for the respective terms of their statutory life through expiration, and are enforceable for purposes of seeking damages for past infringement even post-expiration. *See, e.g., Genetics Institute, LLC v. Novartis Vaccines and Diagnostics, Inc.*, 655 F.3d 1291, 1299 (Fed. Cir. 2011) (“[A]n expired patent is not viewed as having ‘never existed.’ Much to the contrary, a patent does have value beyond its expiration date. For example, an expired patent may form the basis of an action for past damages subject to the six-year limitation under 35 U.S.C. § 286”) (internal citations omitted).
29. The nominal expiration date for the claims of the '435 Patent is no earlier than March 11, 2027.

THE ACCUSED INSTRUMENTALITIES

30. Upon information and belief, Defendant provides, owns, operates, licenses, sells, or otherwise controls the certain parking facilities and/or toll facilities, including but not limited to the infringing means and methods of ingress and egress thereto. In the alternative, Defendant makes, provides, owns, operates, licenses, sells, or otherwise controls the instrumentalities used by its customers and/or individual users to perform the infringing steps as described herein, and thereby induces such customers and/or individual users to directly infringe. On information and belief, such means and methods comprise a network of servers, hardware, software (including software-as-a-service, or SaaS), digital camera technologies, and mobile or web-based interfaces for managing the entering and exiting of vehicles. On information and belief, the infringing NextGen system performs the infringing steps via an interconnected system comprising means for monitoring points of access, means for obtaining vehicle information, means for offering or

otherwise providing a ticket or tag, means for comparing vehicle information, and means for subjecting specific vehicles to a resolution process. On information and belief, the infringing methods as practiced by NextGen are marketed generally as NextGen PARCS and/or PRCS, as well as Designa PreBooking and/or Frictionless. Collectively, all of the foregoing comprises the “Accused Instrumentalities.”

SOLUTIONS

Vehicle Access and Parking Revenue Control Systems (PARCS, PRCS)

Systems solutions allow for a broad range of requirements from Designa's ABACUS for Enterprise Parking & Revenue Control to System Galaxy for Building & Vehicle Access management in garages & office facilities.

Systems feature:

- Enterprise implementations fully compatible with standard IT infrastructures (SQL, TCP/IP)
- Open database architecture for interoperability with 3rd party applications
- Magnetic stripe, bar code ticket media or ticketless
- Tightly integrated LPR, intercom, access readers (AVI, QR, prox) & control rooms functions
- Professional project management with timely, on budget system deliveries

See <http://nextgenparking.net/solutions/>.

Children's Medical Center - PARCS | Dallas, TX

System Description

NextGen Parking has been awarded contracts totaling over \$1.7 million to install a new DESIGNA Parking Access and Revenue Control System (PARCS) and a Quercus Birdwatch LPR system on the Dallas campus of the Children's Health System. The goal of the system implementation is to build upon the customer experience transformation that was initiated by NextGen's installation of a campus-wide Quercus Spot Control Parking Guidance System. The 30-lane system features custom-colored DESIGNA's new Connect Series revenue control equipment complete with integrated dynamic displays on the sides of (10) In.Connect Entry Terminals, (8) Out.Connect Exit Terminals, & (30) Gates as well as integrated displays on the front of (6) PAY Cash&Card Pay-on-Foot machines. The individually-configurable displays will allow Children's to integrate corporate marketing & branding initiatives and communicate important information to their patients, visitors, and employees as they enter and exit their parking facilities. The ParkingHQ Credential Management & Frequent Parker modules will allow patients, visitors, & employees to register their license plate and payment information as well as store prepaid or clinic-issued QR code vouchers in their profile in order to experience frictionless entry and exit. To further improve the customer experience, Children's is implementing the ParkingHQ Control Center application with integrated Commend intercoms & video cameras to allow their Parking Operations Center to expedite the resolution of parking exceptions. The ParkingHQ Business Intelligence and Analytics platform will provide Children's with real-time and historical access to key performance indicators empowering them to continuously improve operations and the customer experience.

NextGen has completed the installation of the license plate recognition system and developed Active Directory integration via LDAP to simplify the management of credentials in the Credential Management module. Completion of the project is scheduled for the third quarter of 2021.

The Village Towers at Bunker Hill - APGS & LPR | Houston, TX

System Description

Located near Houston's famed Memorial City, The Village Towers features a next-generation implementation comprised of the camera-based Quercus Spot Control Parking Guidance and Level Count System as well as in-lane Quercus SmartLPR cameras. The system is powered by the Quercus Birdwatch software and leverages the software's whitelist functionality to notify building management if vehicles are parked in parking zones where they are not permitted. Visitors are permitted to park strictly in visitor spaces with contract parkers being allowed to park in their permitted zones and/or spaces with license plates being captured as vehicles enter and exit each level as well as once they have parked in a specific space.

Additionally, the system supplements security efforts by providing Video Surveillance via a Closed Circuit Television (CCTV) feed of movements in each parking space.

See <http://nextgenparking.net/projects/>.

DESIGNA PRE-BOOKING

One of the best ways to avoid hassle and contact is the pre-booking feature of enhance convenience and safety. The end-user registers at the parking facility's website and schedules a parking time slot. If the parking system uses LPR (license plate recognition) the plate number functions as the ticket. The barrier opens when the pre-booker is entering the parking facility. Payment will be made online and the parker simply exits without any physical contact. Pre-booking adds another possibility for a DESIGNA touchless solution. [Read more](#)

DESIGNA FRICTIONLESS

Frictionless parking goes one further step in enhancing the touchless customer experience. It allows customers to enter the parking garage without pulling a ticket or paying at a pay station. The parking management system already "knows" the customer identified by his or her license plate.

The Frictionless parking system incorporates a payment before entering the parking facility. The customer registers at the operator's website and adds the payment method plus the vehicle identified by the license plate. At the entry, the camera detects the ID of the customer and the gate is opened automatically. When the customer ends the parking no interaction with the automatic cash machine is needed. The parking fee has been already paid in advance via an online profile that has been set up beforehand. [Read more](#)

COUNT I

Infringement of U.S. Patent No. 7,525,435

31. Plaintiff incorporates the above paragraphs by reference.
32. Defendant has been on actual notice of the '435 Patent at least as early as the date it received service of this Original Complaint.
33. Upon information and belief, Defendant owns and/or controls the operation and/or utilization of the Accused Instrumentalities and generates substantial financial revenues therefrom.
34. Upon information and belief, Defendant has directly infringed and continues to directly infringe at least Claim 8 of the '435 Patent by making, using, importing, selling, and/or, offering for sale the Accused Instrumentalities. The Accused Instrumentalities themselves are specially configured to directly perform, and do in fact directly perform, all infringing steps. In the alternative, Defendant indirectly infringes at least Claim 8 of the '435 Patent, at least as of the date of service of this Original Complaint, by inducing others to perform the infringing acts.
35. The Accused Instrumentalities comprise an apparatus which directly performs the claimed method for managing the entering and exiting of vehicles. More specifically, the Accused Instrumentalities comprise a network of servers, hardware, software (including software-as-a-service, or SaaS), digital camera technologies, and mobile or web-based interfaces for managing the entering and exiting of vehicles. On information and belief, such apparatus is installed and

used in the United States, and such apparatus performs the infringing steps entirely within the United States.

36. The Accused Instrumentalities comprise an apparatus which directly performs the step of monitoring points of access to an area so as to detect entering and exiting vehicles. More specifically, and on information and belief, the Accused Instrumentalities comprise one or more cameras equipped with Automatic Number Plate Recognition (“ANPR”) (or functionally equivalent) hardware and/or software and located at or near points of ingress and/or egress of specific areas accessible by motor vehicles (*i.e.*, parking facilities and/or roadways). On information and belief, such Accused Instrumentalities are specially designed and programmed to monitor (and do in fact monitor) points of access and egress so as to detect entering and exiting vehicles, and to capture images thereof and derive data therefrom.
37. The aforementioned ANPR is otherwise alternatively and variously equivalently referred to in the industry as Automatic License Plate Recognition (“ALPR”), or Car Plate Recognition (“CPR”), or License Plate Recognition (“LPR”), or Vehicle License Plate Recognition (“VLPR”), or Mobile License Plate Reader (“MLPR”). Each of these, and other generally similar names, refer generally to systems capable of electronically detecting the license plate characters of a vehicle.
38. The Accused Instrumentalities comprise an apparatus which directly performs the step of obtaining from each said entering vehicle, entering vehicle identification information comprising at least one electronically readable unique repeatable distinguishing characteristic of said entering vehicle and storing said entering vehicle information in an information management system. More specifically, and on information and belief, the Accused Instrumentalities comprise one or more cameras equipped with Automatic Number Plate Recognition (“ANPR”) (or functionally equivalent) hardware and/or software and located at or near points of ingress and/or egress of

specific areas accessible by motor vehicles (*i.e.*, parking facilities and/or roadways). On information and belief, such Accused Instrumentalities are specially designed and programmed to monitor (and do in fact monitor) points of access and egress so as to detect entering and exiting vehicles, and to capture images thereof and derive data therefrom. More specifically, and on information and belief, such Accused Instrumentalities are programmed and configured such that they derive (“obtain”) vehicle license plate data (an “electronically readable unique repeatable distinguishing characteristic of said entering vehicle”) from incoming and exiting vehicles, including via the aforementioned ANPR or functionally equivalent technology. Further, and on information and belief, the Accused Instrumentalities are configured such that they store the derived vehicle data in a database or other electronic storage system which serves as an information management system.

39. The Accused Instrumentalities comprise an apparatus which directly performs the step of offering said entering vehicle a security option. More specifically, and on information and belief, the Accused Instrumentalities are configured such that they assign (or pre-assign) a ticket or transaction number (or code) to each vehicle, and such code is associated with the vehicle information (the license plate data) in the aforementioned information management system. Still further, and on information and belief, the Accused Instrumentalities are configured such that they electronically encode and form a paper or electronic ticket or receipt which incorporates at least the aforementioned ticket or transaction number. On information and belief, such ticket or receipt is offered or otherwise provided to the driver of the vehicle (or to another individual as the agent of the vehicle) via either electronic or physical means.
40. The Accused Instrumentalities comprise an apparatus which directly performs the step of obtaining from each said exiting vehicle, exiting vehicle identification information comprising said

unique repeatable distinguishing characteristic of said exiting vehicle. More specifically, and on information and belief, and as noted above, the Accused Instrumentalities comprise one or more cameras equipped with Automatic Number Plate Recognition (“ANPR”) (or functionally equivalent) hardware and/or software and located at or near points of ingress and/or egress of specific areas accessible by motor vehicles (*i.e.*, parking facilities and/or roadways). On information and belief, such Accused Instrumentalities are specially designed and programmed to monitor (and do in fact monitor) points of access (including exit locations) so as to detect entering and exiting vehicles, and to capture images thereof and derive data therefrom. More specifically, and on information and belief, such Accused Instrumentalities are programmed and configured such that they derive (“obtain”) vehicle license plate data (an “electronically readable unique repeatable distinguishing characteristic of said entering vehicle”) from incoming and exiting vehicles, including via the aforementioned ANPR or functionally equivalent technology.

41. The Accused Instrumentalities comprise an apparatus which directly performs the step of comparing the respective said exiting vehicle identification information with the stored said entering vehicle identification information in said information management system for matching information whereby vehicle identification is confirmed. More specifically, and on information and belief, and as noted above, the Accused Instrumentalities comprise an information management system which stores vehicle identification information. On information and belief, the Accused Instrumentalities are configured such that they compare the vehicle identification information obtained from exiting vehicles with the vehicle identification information stored in a database (as obtained from entering vehicles) in order to confirm a match (or an absence of a match) between the two sets of data.

42. The Accused Instrumentalities comprise an apparatus which directly performs the step of permitting exiting vehicles with said matching information to exit. More specifically, and on information and belief, and as noted above, the Accused Instrumentalities are configured such that they compare the vehicle identification information obtained from exiting vehicles with the vehicle identification information stored in a database (as obtained from entering vehicles) in order to confirm a match (or an absence of a match) between the two sets of data. On information and belief, in the event a match is confirmed, the Accused Instrumentalities are configured such that they permit vehicles with matching information to exit by fulfilling the transaction associated with the entry to the designated area and by permitting the physical exit of the vehicle.
43. The Accused Instrumentalities comprise an apparatus which directly performs the step of subjecting exiting vehicles without said matching information to a resolution process. More specifically, and on information and belief, and as noted above, the Accused Instrumentalities are configured such that they compare the vehicle identification information obtained from exiting vehicles with the vehicle identification information stored in a database (as obtained from entering vehicles) in order to confirm a match (or an absence of a match) between the two sets of data. On information and belief, in the event a match is not confirmed, the Accused Instrumentalities are configured such that they subject such vehicles to a resolution process comprising at least the issuance of an invoice for payment and/or the detainment of the vehicle pending resolution.
44. The foregoing infringement on the part of Defendant has caused past and ongoing injury to Plaintiff. The amount of damages adequate to compensate for the infringement shall be determined at trial but is in no event less than a reasonable royalty from the date of first infringement to the expiration of the '435 Patent.

45. To the extent Defendant continues, and has continued, its infringing activities noted above in an infringing manner post-notice of the '435 Patent, such infringement is necessarily willful and deliberate.
46. On information and belief, Defendant has a policy or practice of not reviewing the patents of others. Further on information and belief, Defendant instructs its employees to not review the patents of others for clearance or to assess infringement thereof. As such, Defendant has been willfully blind to the patent rights of Plaintiff.
47. Each of Defendant's aforesaid activities have been without authority and/or license from Plaintiff.

PRAYER FOR RELIEF

WHEREFORE, Performance Partners LLC respectfully requests the Court enter judgment against Defendant as follows:

1. Declaring that Defendant has infringed the Asserted Patent(s);
2. Awarding PerformancePartners LLC its damages suffered because of Defendant's infringement of the Asserted Patent(s);
3. Awarding PerformancePartners LLC its costs, reasonable attorneys' fees, expenses, and interest;
4. Granting a permanent injunction pursuant to 35 U.S.C. § 283, enjoining Defendants from further acts of infringement with respect to the Asserted Patent(s);
5. Awarding PerformancePartners LLC ongoing post-trial royalties for infringement of the non-expired Asserted Patent(s); and
6. Granting PerformancePartners LLC such further relief as the Court finds appropriate.

JURY DEMAND

PerformancePartners LLC demands trial by jury, under Fed. R. Civ. P. 38.

Dated: March 14, 2023
